TITLE: Oil Spill Drill Simulation

The operatives reacted to the spill simulation and due to then knowing the unharmful nature of the substance quickly placed some socks and pads down from the Spill Kit located outside Goods In to prevent the oil going down the drain. The valve was checked, and it had loosened in transport across the bumpy yard so it was shut off to prevent any further leakage.

If the spill is an unknown substance or chemical, then suitable protective PPE must be obtained first.

They then isolated the doors to prevent MHE access across the area to avoid spreading the spill and continued placing pads down to soak up the oil. Once most of the spill had soaked in to the pads the operative wiped down up the remainder and put all the pads and socks in to the marked bag to be taken to the yard team for disposal.

The operatives then explained that with it being oil that once they had finished, they would then get the floor washer/scrubber to remove any residue to avoid MHE and pedestrians and prevent a slip hazard.
